

1- Create config object class inside a package

- > import UVM package and include UVM macros file
- > Add uvm_object_utils macro
- > Constructor
- > Declare the virtual interface

2- Create uvm driver class inside a package

- > import UVM package and include UVM macros file
- > Add uvm_component_utils macro
- > Declare virtual interface and configuration object handle
- > Constructor
- > Build phase: get the configuration object from configuration database
- > Connect phase: connect the virtual interface to the virtual interface of the configuration object
- > run phase: Drive the interface, start by resetting the design then applying random data using \$random with each clock edge

Notes:

- 1- Import the above packages in the appropriate files shared with you.
- 2- Add the above files created in the correct order in the src_files.list
- 3- The remaining files shared with you have the steps to be done inside of them.
